Our OvalEdge Partnership

Empowering organizations to discover, govern, and trust enterprise data.

Modern enterprises manage data across cloud platforms, on-premises systems, business applications, data warehouses, and analytics platforms — leaving many to face fragmented metadata, inconsistent business definitions, limited visibility into data movement, and manual governance processes.

OvalEdge addresses this through a unified platform spanning metadata management, enterprise data cataloging, business glossary, lineage, governance workflows, data quality, and privacy management, with AI built into every stage — from automated discovery and classification to lineage generation, catalog enrichment, and natural language search through AskEdgi. By connecting business and technical metadata, organizations gain stronger data discovery, governance, regulatory compliance, and confidence in enterprise data.

Blue Altair partners with enterprises to successfully deploy OvalEdge using a proven governance framework that accelerates time-to-value, enhances data stewardship, and delivers sustainable governance outcomes at scale.

Our OvalEdge Offering

Blue Altair takes a business-led approach to governance - helping organizations move from implementing a platform to embedding governance into how the business operates.

- **Business-Led, Not Tool-Led**
  We start with business priorities and real governance challenges, not a standard governance template. Wherever OvalEdge's native capabilities cover the need, we configure them directly; wherever they don't, we extend the platform with custom workflows, scripts, integrations, and purpose-built AI models tailored to the organization's specific requirements.
- **Prioritized, Not Big-Bang**
  We start with the data domains and use cases that matter most to the business, prove value quickly, and scale progressively across the enterprise — rather than attempting a full rollout on day one and risking stalled adoption.
- **Owned by the Business**
  We establish clear ownership and stewardship from the outset, with business teams defining and approving the rules, definitions, and standards that govern their own data, so governance decisions stay with the people accountable for the outcomes.
- **Designed for Adoption**
  We embed governance into day-to-day work through practical workflows, role-based training, stewardship enablement, and ongoing stakeholder engagement — so governance becomes a habit built into how the business operates, not a separate initiative layered on top.
- **Built to Evolve**
  We continuously refine the program as data volumes, business priorities, technology, and regulatory requirements change, with Blue Altair providing ongoing expertise, monitoring, and support well beyond initial go-live.

The OvalEdge Difference That Delivers Advantage

OvalEdge brings together core enterprise data governance capabilities - catalog, metadata, glossary, lineage, data quality, privacy, compliance, workflows, ownership, and governed data consumption - on a unified platform.

Built on this foundation, OvalEdge adds intelligence, automation, and connected context to make governance more efficient and scalable. The Enterprise Context Graph, Governance Agents, and AskEdgi extend governance from managing data to understanding, governing, and using it more effectively.

AskEdgi

AskEdgi brings governed enterprise data and metadata into a natural-language experience, allowing users to ask questions, discover relevant data, and work with trusted business context without relying solely on traditional catalog search or technical queries.

OvalEdge Governance Agents

AI agents take on repetitive, high-volume governance activities while teams remain in control. Apex helps prioritize governance effort, Curo enriches and curates catalog metadata, and Lingo helps build and maintain business glossary content.

Context-Driven Governance

Governance effort can be directed toward the data that matters most using signals such as popularity, business importance, actual consumption, quality, sensitivity, and impact — helping teams prioritize critical data rather than attempting to curate everything equally.

Enterprise Context Graph

Connects catalog, glossary, lineage, quality, policies, ownership, and business context to create a single, trusted understanding of enterprise data — giving both users and AI agents the context needed to understand and use data correctly.

Automated Data Curation

OvalEdge automates foundational curation through capabilities such as Auto-Lineage, PII Detection and Classification, Auto-Classification, and AI-powered Question Wall, reducing the manual effort required to discover, document, classify, and contextualize data.

About Blue Altair

Blue Altair is a niche, industry-recognized business and technology consulting firm that assists our clients with digital transformations. We offer Assessment and Strategy, Technology Implementation, and Managed Services in API Management and Integration; Data Management; Digital Application Development; and Data Science and AI. Our Client Success capability ensures a higher-than-industry rate of successfully delivered projects, with a primary focus on program and project management, business analysis, and quality assurance. Blue Labs is our innovation hub, where we use cutting-edge technology to build offerings that deliver accelerators and solutions. Our culture is the heart of our existence, and our core values are the key drivers for our handpicked, top-tier performers.
